The Effects of Divorce on Children

Patrick F. Fagan and Aaron Churchill

January 11, 2012

Introduction

Each year, over a million American children suffer the divorce of their parents. Divorce causes irreparable harm to all involved, but most especially to the children. Though it might be shown to benefit some individuals in some individual cases, over all it causes a temporary decrease in an individual’s quality of life and puts some “on a downward trajectory from which they might never fully recover.”

Divorce damages society. It consumes social and human capital. It substantially increases cost to the taxpayer, while diminishing the taxpaying portion of society. It diminishes children’s future competence in all five of society’s major tasks or institutions: family, school, religion, marketplace and government. The reversal of the cultural and social status of divorce would be nothing less than a cultural revolution. Only a few generations ago, American culture rejected divorce as scandalous. Today, law, behavior, and culture embrace and even celebrate it.

Divorce also permanently weakens the family and the relationship between children and parents. It frequently leads to destructive conflict management methods, diminished social competence and for children, the early loss of virginity, as well as diminished sense of masculinity or femininity for young adults. It also results in more trouble with dating, more cohabitation, greater likelihood of divorce, higher expectations of divorce later in life, and a decreased

---

desire to have children. Paul Amato, professor of sociology at Pennsylvania State University summed it up: divorce leads to “disruptions in the parent-child relationship, continuing discord between former spouses, loss of emotional support, economic hardship, and an increase in the number of other negative life events.”

The last year for accurate numbers on children annually affected by divorce was 1988 when the Center for Disease Control stopped gathering the data. That year the number was over 1,044,000. However, since then the percent of women who have been divorced has continued to rise. Therefore, conservatively, we estimate the number to be at least 1,000,000 children per year. Should one add the number affected by the dissolution of “an always intact” cohabitation of natural parents, the number is significantly greater. We do know that for all U.S. children, as of the latest data from the 2009 American Community Survey, only 47 percent reach age 17 in an intact married family.

Divorce detrimentally impacts individuals and society in numerous other ways:

- Religious practice: Divorce diminishes the frequency of worship of God and recourse to Him in prayer.
- Education: Divorce diminishes children’s learning capacity and educational attainment.
- The marketplace: Divorce reduces household income and deeply cuts individual earning capacity.
- Government: Divorce significantly increases crime, abuse and neglect, drug use, and the costs of compensating government services.
- Health and well-being: Divorce weakens children's health and longevity. It also increases behavioral, emotional, and psychiatric risks, including even suicide.

The effect of divorce on children’s hearts, minds, and souls ranges from mild to severe, from seemingly small to observably significant, and from short-term to long-term. None of the effects applies to each child of every divorced couple, nor has any one child suffered all the effects we will discuss. There is no way to predict how any particular child will be affected nor to what extent, but it is possible to predict divorce’s societal effects and how this large cohort of children will be affected as a group. These effects are both numerous and serious.

The major issue for researchers is no longer to learn what the ill effects of divorce are, but to understand the extent of these effects on children and grandchildren and to identify ways of reversing their intergenerational cycle.

I. Effects on the Family: Cyclical Brokenness

A. Weakened Parent-Child Relationships

When parents divorce each other, another sort of divorce occurs between the parents and their children. The primary effect of divorce (and of the parental conflict that precedes the divorce) is a decline in the relationship between parent and child. Immediate after a divorce, most parents have two sets of problems: their adjustment to their own intrapsychic conflicts and to their role as a divorced parent. The stress of divorce damages the parent-child relationship for as many as 40 percent of divorced mothers.7 The support they receive from home is rated much lower by children of divorced parents than by children from intact homes,8 and these negative ratings become more pronounced by the time children are in high school9 and college.10

Children in divorced families receive less emotional support, financial assistance, and practical help from their parents. Divorced homes show a decrease in language stimulation, pride, affection, stimulation of academic behavior, encouragement of social maturity, and warmth directed towards the children. The presence of fewer toys and games is common, as is an increase in physical punishment.12 Though some studies show that parental divorce itself may not

---

affect parenting, it often leads to worry, exhaustion, and stress for parents. These factors affect both parenting and parental control. Thus, divorce and separation result in less caring and more overprotective parenting during the adolescent years.

Though the child’s ability to trust their parents, close friends, and others “is strongly linked to positive parent-teen relationships regardless of parental divorce,” parental divorce makes it more difficult for children to trust their parents, while a “decline in the closeness of the parent-child relationship mediates much of the association between parental divorce, marital discord, and offspring’s psychological wellbeing in adulthood.”

Though one review of the literature conducted in the United Kingdom found “that although children are at increased risk of adverse outcomes following family breakdown and that negative outcomes can persist into adulthood, the difference between children from intact and non-intact families is a small one, and the majority of children will not be adversely affected in the long-term,” the rest of this paper contradicts this conclusion.

B. Weakened Mother-Child Relationships

Children of divorced mothers have poorer and less stimulating home environments. Furthermore, divorced mothers, despite their best intentions, are less able than married mothers to give emotional support to their children. Divorce also causes a slight decline in children’s trust of their mothers when parental divorce occurs between birth and age four; however, after controlling for

---

the quality of the parent-child relationship, this effect all but disappears.\textsuperscript{21} Compared with continuously-married mothers, divorced mothers tend to be less affectionate and communicative with their children, and to discipline them more harshly and more inconsistently, especially during the first year following the divorce.\textsuperscript{22}

Divorced mothers have particular problems with their sons, though their relationship will likely improve within two years,\textsuperscript{23} even if, as often occurs, discipline problems persist for up to six years after the divorce.\textsuperscript{24}

\textbf{C. Weakened Father-Child Relationships}

\textbf{Contact.} Divorce leads to a decline in the frequency and quality of parent-child contact and relationships,\textsuperscript{25} and it becomes difficult for nonresidential parents, 90 percent of whom are fathers, to maintain close ties with their children.\textsuperscript{26} For example, children spend significantly more nights with their mother than their father.\textsuperscript{27} Nearly 50 percent of the children in one study reported not seeing their nonresident father in the past year, and the small number that had recently stayed overnight at the father’s residence did so for a special visit, not as part of a regular routine.\textsuperscript{28} An analysis of the National Survey of Families and

\begin{footnotesize}
\begin{enumerate}
\end{enumerate}
\end{footnotesize}
Households found that about one in five divorced fathers had not seen his children in the past year, and fewer than half the fathers saw their children more than a few times a year. By adolescence (between the ages of 12 and 16), fewer than half of children living with separated, divorced, or remarried mothers had seen their fathers at all in more than a year, and only one in six saw their fathers once a week.

Contact with the father declines over time after a divorce, though this pattern is less pronounced the older the child is at the time of the divorce. Daughters of divorced parents were 38 percent less likely than their peers in intact families to have frequent contact with their fathers, and sons of divorced parents were 20 percent less likely.

**Emotional Closeness and Well-being.** Children’s relationships with their parents worsen after a divorce. Marital disruption creates distance between parents and children, even compared to children living in married but unhappy families. Divorced parents also report significantly diminished satisfaction with their former spouse’s relationships with their children, though parental divorce

percent of the children whose fathers were nonresident had never-married (as opposed to married and then divorced or separated) fathers.

29 This is a federally funded survey of 13,000 respondents conducted by the University of Wisconsin in 1987-1988, 1992-1994, and 2001-2003.

tends to affect the relationship of the child and the opposite-sex parent more than the child and their parent of the same sex.38

Father Rated Warm and Loving

Source: National Longitudinal Survey of Adolescent Health Wave 2, 1996

Divorced fathers, especially non-custodial fathers, do not fare well with their children. Children report more distant relationships with their fathers,39 and fathers report “a more negative change in their relationships with their children than [do] custodial mothers.”40 The pattern of worsening relationships after the breakup holds for both sons41 and daughters,42 and more conflict during the divorce process increases the likelihood of distance between the father and his children.43 However, as time passes after the breakup, conflict between father and child decreases. Additionally, older children typically experience less conflict with their nonresident fathers than do younger children.44

Divorce leads to a decline in children’s ability to trust their fathers,\textsuperscript{45} which does not bode well for the lifetime happiness of divorced children. Young adults who feel emotionally close to their fathers tend to be happier and more satisfied in life, regardless of their feelings towards their mothers.\textsuperscript{46} However, children and adolescents who do feel close to the father following a divorce experience better outcomes.\textsuperscript{47}

Children from divorced families receive less emotional support from their fathers than children from intact families.\textsuperscript{48} Divorced fathers are less nurturing,\textsuperscript{49} and more likely to drift away from younger children if denied legal custody at the time of the divorce.\textsuperscript{50} Nonresident fathers also “have considerably less opportunity to influence their children's attitudes and behavior,”\textsuperscript{51} a reality of which the implications this paper will attempt to explore. Ultimately, the proportion of children who enjoy a consistently close relationship with their father is much higher among adolescents whose parents remain married (48 percent) than among those whose parents divorce (25 percent).\textsuperscript{52}

**Persisting Effects.** Boys, especially if they live with their mother, respond with more hostility to parental divorce than girls do, both immediately following the divorce and for a period of years thereafter.\textsuperscript{53} Girls often fare worse than boys when living with their father or stepfather after a parental divorce.\textsuperscript{54} By the time

children, particularly daughters, attend college, their affection for their divorced father wanes significantly.  

D. Weakened Grandparent-Grandchild Relationships

Divorce negatively affects grandparent/grandchild relationships. Paternal grandparents frequently cease to see their grandchildren as their grandchildren’s contact with their own father, the grandparents’ son, diminishes. Furthermore, compared to never-divorced grandparents, grandparents who were themselves divorced had less contact with their adolescent grandchildren and engaged in fewer shared activities with them, and divorced grandparents are less likely to agree that their grandchildren are a valuable part of their lives. Divorced paternal grandparents were less likely to play a mentoring role in the life of their grandchildren than divorced maternal grandparents.

E. Children’s View of Divorce

Regardless of age, children of divorce deeply resent the strains and difficulties which arise in long-held family celebrations, traditions, daily rituals, and special times, and rate these changes as major losses. Grown children continue to see their parents’ divorce very differently than do the parents. Judith Wallerstein, a clinical psychologist from San Francisco, was the first to disturb the nation in 1980 with her research on the effects of divorce on children. She found that 10 percent of children felt positively about the parents’ divorce, but 80 percent of the divorced mothers and 50 percent of the divorced fathers judged the divorce good for them 15 years after the divorce.

Girls. Young men and women react in slightly different ways to their parent’s divorce. Young women from divorced families will feel a need for love and attention and yet fear abandonment; they will also be prone to both desire and
anxiety. Women whose parents divorce are likely to be hampered or even overwhelmed by anxiety when it comes time to make decisions about marriage, though some “women with no ill effects from paternal divorce, may develop [the] security of friendship-based love quite well.” One study linked parental divorce to lower relationship commitment and confidence in women but not in men.

Boys. While parental divorce affects the child’s view of marriage, girls may be less influenced in their attitudes towards divorce “because they have more role models of intimacy and marriage as the ideal in their environment than boys do, especially in the media.” By contrast, boys have fewer role models of intimacy outside of their families. Hence a father’s modeling if interpersonal skills is more important for boys. Men from father-absent homes also experience less masculine sexual identification and more feminine sexual identification.

Men whose parents divorced are inclined to be simultaneously hostile and a “rescuer” of the women to whom they are attracted, rather than the more open, affectionate, cooperative partner, more frequently found among men raised by parents of an intact marriage. By contrast, the problem of being overly meek or overly dominant is much more prevalent in the romantic relationships and marriages of the daughters of divorced families than it is among daughters of intact marriages.

---

F. Children’s Weakened Ability to Handle Conflict

Divorce diminishes children’s capacity to handle conflict. The difference between marriages that remain intact and those that end in divorce lies primarily in the couple’s ability to handle marital conflict and move towards agreement. Parental modeling clearly diminishes many children’s capacity for stable marriage later in life, though some children may react by doubling their efforts to ensure stability.

For instance, compared to students from intact families, college students from divorced families use violence more frequently to resolve conflict and are more likely to be aggressive and physically violent with their friends, male or female.\(^{71}\)

In their own marriages, children of divorced parents are more likely to be unhappy, to escalate conflict, to communicate less, to argue frequently, and to shout or to physically assault their spouse when arguing.\(^{72}\) Thus, the likelihood of divorce is transmitted across generations.\(^{73}\)

---

\(^{73}\) Researchers have found that the children of violent parents do better if their parents separate. However, if the parents’ conflict is not violent or intense, their children fare better in their own marriages if their parents remain married. Obviously, the best solution for all concerned is that parents learn how to handle conflict and to cooperate with each other, thereby restoring family harmony.
G. Children’s Diminished Social Skills

Social Skills. Gerald Patterson of the Oregon Social Learning Center concluded that “poor social skills, characterized by aversive or coercive interaction styles, lead directly to rejection by normal peers.” Fear of such peer rejection is twice as likely among adolescents of divorced parents. Their social relations are likely to be damaged in several ways and characterized by more problems relating to peers, fewer childhood friends, and a greater tendency to complain about lack of peer support. Kent State University faculty members conducted a major national study on the effects of divorce in 1987. The study found that, compared to children from intact families, children of divorced parents did worse when rated by both parents and teachers on peer relationships, hostility towards adults, anxiety, withdrawal, inattention, and aggression.

Psychological Behaviors. A variety of psychological outcomes are associated with parental divorce that lead to vulnerability in some children and resiliency in others. According to one study, child antisocial behavior decreases after the dissolution of marriages in highly dysfunctional families, and “the higher the level of family dysfunction prior to divorce, the greater the reduction in child antisocial behavior after the divorce.” Nevertheless, children whose parents

78 Sylvie Drapeau and Camil Bouchard, “Support networks and adjustment among 6 to 11 year-olds from maritaly disrupted and intact families,” Journal of Divorce and Remarriage 19 (1993): 75-97. Daughters of divorced parents, in a University of Michigan study, had significantly greater difficulty in having and keeping friends and were more frequently depressed while at college. See Kristen M. McCabe, “Sex Differences in the Long-term Effects of Divorce on Children: Depression and Heterosexual Relationship Difficulties in the Young Adult Years,” Journal of Divorce and Remarriage 27 (1997): 123-134.
divorce will exhibit more anxiety and depression and antisocial behavior than children from intact families.\textsuperscript{83}

Children who experience divorce at any age will continue to be affected their whole lives, tending to “exhibit higher malaise scores at age 33 than their contemporaries whose parents remained married.”\textsuperscript{84}

\textbf{Behavioral Problems.} Children of divorced or separated parents exhibit increased behavioral problems,\textsuperscript{85} and the marital conflict that accompanies parents’ divorce places the child’s social competence at risk. Even in intact families that have low to medium levels of conflict, children still have “fewer behavior problems than those in the high-conflict, disrupted families.”\textsuperscript{86} Another study suggests that parental conflict affects the outcomes of children’s behavior problems, regardless of parents’ marital status, and sometimes “there is no statistical difference in the level of behavior problems observed for children whose parents separated or divorced and for children whose parents remained together.”\textsuperscript{87}

During a divorce, conflict between parents is often accompanied by less affection, less responsiveness, and more inclination to punish their children, which leaves their children feeling emotionally insecure.\textsuperscript{88} These children are more likely to perceive their social milieu as unpredictable and uncontrollable.\textsuperscript{89} Children who engage in fighting and stealing at school are far more likely to come from broken homes than are well-behaved children.\textsuperscript{90} Other studies have confirmed that children of divorced parents exhibit more behavioral problems than do children

\textsuperscript{86} Donna Ruane Morrison and Mary Jo Coiro, “Parental Conflict and Marital Disruption: Do Children Benefit When High-Conflict Marriages Are Dissolved?” \textit{Journal of Marriage and the Family} 61 (1999): 634.
from intact families.\textsuperscript{91} Boys whose parents divorced while they were in elementary school tend to develop problems in the years following their parents’ separation. While problem behavior increases immediately following the divorce among boys whose parents divorced while they were in middle school, their problem behavior steadily decreases in the year after the divorce.\textsuperscript{92}

### H. Children’s Early Departure from Home

Children of divorced parents move away from their families of origin in greater proportions\textsuperscript{93} and earlier\textsuperscript{94} than do children of intact marriages due to low levels

\textsuperscript{93} Andrew J. Cherlin, Kathleen E. Kiernan, and P. Lindsay Chase-Lansdale, “Parental Divorce in Childhood and Demographic Outcomes in Young Adulthood,” \textit{Demography} 32 (1995): 299-316.

of family cohesion and harmony. The greater the unhappiness in their parents’ marriage, the earlier children leave home to get married, cohabit, or live on their own. Some children who experience marital disruption in adolescence may leave home “at such young ages that it resembles running away from home.”

Furthermore, compared with children living in intact, two-parent families, runaway children with stepparents are only 70 percent as likely to return home. Stepchildren are over 20 percent more likely to leave home earlier. According to Frances K. Goldscheider and Calvin Goldscheider, “children whose families gained a stepparent while they were adolescents . . . increase their odds of leaving home to marry by about 100 percent.”

I. Children’s Sexual Practices and Attitudes as Adults

Attitudes toward Sexuality. When parents divorce, their children’s attitudes about sexual behavior change. Children’s approval of premarital sex, cohabitation, and divorce rises dramatically, while their endorsement of marriage and childbearing falls. Children from divorced families are also more likely to believe that marriage is not important prior to having children and are more likely to have a child out of wedlock. This holds true even after controlling for socioeconomic status. Furthermore, sexual permissiveness on the part of

---

divorced parents significantly increases permissive attitudes and behavior in both their sons and daughters.\textsuperscript{103}

\textbf{"Ever Had Intercourse at 14 Years of Age or Younger"}

\textit{Source: National Longitudinal Survey of Youth (1997)}

\begin{figure}
\centering
\includegraphics[width=\textwidth]{chart.png}
\end{figure}

Children from divorced families have an earlier sexual debut than children from intact families.\textsuperscript{104} American\textsuperscript{105} and British\textsuperscript{106} studies repeatedly show that daughters of divorced parents will be more likely to approve of premarital sexual intercourse\textsuperscript{107} and teen sexual activity\textsuperscript{108} and to engage in early sexual intercourse

outside of marriage. The National Longitudinal Survey of Youth reports that African-American girls are 42 percent less likely to have sexual intercourse before age 18 if their biological father is present at home. By contrast, the presence of a stepfather increases by 72 percent the likelihood of sexual intercourse before age 18 for Latino girls.

In addition to an increased likelihood of being sexually active, girls from divorced families are more likely to engage in risky sexual behavior, to have more frequent sexual intercourse, and to have more sexual partners. In a study comparing girls from New Zealand and the United States, researchers found that the earlier a father leaves the home, the higher his daughter’s risk of early sexual activity and teenage pregnancy. In the United States, girls whose fathers had left before their daughters were five years old were eight times more likely to become pregnant while adolescents than were girls whose fathers remained in the home.

For sons, parental divorce is correlated with adolescent sexual intercourse, earlier sexual debut, and the acquisition of a sexually transmitted disease. Other studies have confirmed that male children of divorce have more relationships and more sexual partners than young men from intact families.

The influences of divorce on sexual behavior extends into adulthood: Adults raised in divorced families are more likely to engage in short sexual affairs and also have more sexual partners than adults from intact families.

**Sexual Behaviors.** Virginity among teenagers of all ages correlates closely with the presence of married parents. Each change in family structure during adolescence (from married to divorced, from single to married, or from divorced to stepfamily) increases the risk of initiation of sexual intercourse for many of the teenage children in these unions.

The children of divorce date more and thus have a higher turnover of dating partners and more failed romantic relationships, may contribute to a larger number of sexual partners, a risk factor for the acquisition of sexually transmitted diseases and a host of emotional repercussions. Even without the

addition of a working mother, divorce leads to an above-average number of sexual partners for the children of divorce as adults.\textsuperscript{123}

Following a divorce, most mothers have to work full-time. This combination of divorce and a full-time working mother leads to the highest level of teenage sexual activity\textsuperscript{124} and is significantly correlated with multiple sexual partners in adult life.\textsuperscript{125}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{chart.png}
\caption{"Ever Had an Unwed Pregnancy" by Structure of Family of Origin}
\end{figure}

Pregnancy. Women whose parents separated during childhood are more likely to have an out-of-wedlock teenage pregnancy,\textsuperscript{126} and men with divorced or separated parents are more likely to father a child with a teenage mother.\textsuperscript{127} In

\begin{itemize}
\item Sara McLanahan and Larry Bumpass, “Intergenerational Consequences of Family Disruption,” \textit{American Journal of Sociology} 94 (1988): 130-152.
\end{itemize}
Britain, the phenomenon of out-of-wedlock pregnancy to children of divorced parents has also been found.\textsuperscript{128}

**Abortion.** Daughters of divorced parents have more abortions than the daughters of non-divorced parents, according to a Finnish study.\textsuperscript{129}

**J. Children’s Increased Trouble in Romantic Relationships**

**Trust in Relationships.** Parental divorce often leads to low trust among children,\textsuperscript{130} and those who casually date exhibit “the strongest effects of parental divorce, suggesting that the repercussions of parental divorce may be in place before the young adults form their own romantic relationships.”\textsuperscript{131} The divorce of their parents makes dating and romance more difficult for children as they reach adulthood. Parental divorce horrifies young adults’ heterosexual relationship experiences though the connection is more evident for women than for men, according to one study.\textsuperscript{132}

The effects carry into adulthood. When compared with women from intact families, women from divorced families also reported less trust and satisfaction in romantic relationships.\textsuperscript{133} Children of divorced parents fear being rejected, and a lack of trust frequently hinders a deepening of their relationship.\textsuperscript{134} One study showed that individuals whose parents divorced were more likely than individuals whose parents remained married to believe that relationships were beset by infidelity and the absence of trust, and they were also more likely to believe that relationships should be approached with caution.\textsuperscript{135}

\textsuperscript{128} Andrew J. Cherlin, Kathleen E. Kiernan, and P. Lindsay Chase-Lansdale, “Parental Divorce in Childhood and Demographic Outcomes in Young Adulthood,” *Demography* 32 (1995): 299-316.
General Attitudes toward Marriage. One study reported that persons raised in divorced families have less positive attitudes towards marriage, and more positive attitudes towards divorce. This negative attitude about marriage leads to decreased commitment to romantic relationships, which in turn is related to lower relationship quality.\textsuperscript{136} In Sweden, where parental rejection is very high, no significant differences were found between individuals from divorced and intact families in their attitudes towards marriage and divorce.\textsuperscript{137} Thus the more common divorce and rejection is among adults, the more the attitudes and expectations of rejection are mainstreamed among children, even those raised in intact married families.

Adult male children of divorced parents show more ambivalence than men from intact families about becoming involved in a relationship,\textsuperscript{138} though they invest more money and tangible goods in casual dating relationships. Women share this ambivalence and demonstrate even more conflict, doubt, and lack of faith in their partner’s benevolence and tend to place less value on consistent commitment.\textsuperscript{139} Unwed teen mothers, who have expectations of rejection and divorce in relationships, seem to retain negative attitudes towards men instilled by their parents’ divorce.\textsuperscript{140}

Attitudes about Divorce and Marriage. Compared with children of always-married parents, children of divorced parents have more positive attitudes towards divorce\textsuperscript{141} and less favorable attitudes towards marriage.\textsuperscript{142} Specifically, “adolescents who have experienced their parents’ divorces and remarriages may feel that marriage is unpredictable and unstable.”\textsuperscript{143} People raised in divorced families are less likely than those from intact families to believe that marriage is

\begin{footnotesize}
\begin{itemize}
\end{itemize}
\end{footnotesize}
enduring and permanent,\textsuperscript{144} are less likely to insist upon a lifelong marital commitment,\textsuperscript{145} and are less likely to think positively of themselves as parents.\textsuperscript{146}

These attitudinal differences among children of divorced parents are noticeable even as early as kindergarten.\textsuperscript{147} Children from divorced families are more tolerant of divorce than are children from intact families, though this is only likely if their parents had remarried. Without remarriage, the effect on their views of divorce was not significant.\textsuperscript{148} The mothers’ accepting attitudes toward divorce causes more children to be accepting of divorce themselves.\textsuperscript{149} These positive attitudes towards divorce affect not only likelihood of divorce, but also overall relationship quality.

After controlling for age, high levels of post-divorce interparental conflict are associated with less positive views of marriage among adolescents.\textsuperscript{150} One study of adolescents after a parental divorce reported that many children fear that their future marriages will lack love, trust, or communication, and that they will be beset by infidelity, conflict, or abuse. They also worry that their marriages will fail or that their spouse will abandon them,\textsuperscript{151} a finding common to another study published that year (2008).\textsuperscript{152}

In her study of children of divorced parents from Marin County, California, Judith Wallerstein found that the children of divorced parents still had persistent anxiety about their chances of a happy marriage a decade after their parents’ divorce. This anxiety interfered with their ability to marry well: Some failed to form satisfying romantic ties, while others rushed impulsively into unhappy

\begin{reftext}

\textsuperscript{149} Mick Cunningham and Arland Thornton, “The Influences of Parents’ and Offsprings’ Experience with Cohabitation, Marriage, and Divorce on Attitudes Toward Divorce in Young Adulthood,” \textit{Journal of Divorce and Remarriage} 44, no. 1 (2005): 119-144.

\end{reftext}
marriages. The evidence shows that “adult children of divorce who eventually wed are more likely to divorce than are adult children from intact families.”

**Expectations to Marry or Divorce.** The children of divorced parents, stepfamilies, or single parents are less likely to expect to marry. Children who have experienced parental divorce are more likely to expect to divorce, compared with children of intact families. Children of divorce also have more negative attitudes towards marriage and a preference for smaller family sizes, although the negative attitudes are mitigated by their parents’ remarriage.

**Likelihood to Marry or Divorce.** Clearly, one generation passes on its marital instability to the next. Sons of divorced parents with less educated mothers have an increased tendency to forgo marriage. Additionally, parental divorce

---

raises children’s likelihood of divorce.\textsuperscript{161} Children who have experienced parental divorce are more than twice as likely to divorce, compared with children of intact families.\textsuperscript{162} One study found that adults who experience parental divorce have chances of divorce 38 percent higher than adults raised in intact families. Significantly, this increase is not seen in children whose parents’ marriage ended because of the death of one of the parents.\textsuperscript{163}

Children of divorce are 39 percent more likely to marry other children of divorce, after controlling for education. Couples with one spouse from a divorced home are nearly twice as likely to divorce as couples with both spouses from non-divorced families. Worse still, couples with both spouses from divorced families over three times more likely to divorce than couples with both spouses from non-divorced families.\textsuperscript{164}

Children who experience three or more transitions in family structure are much more likely to divorce later in life, compared to children who did not experience such family transitions.\textsuperscript{165} That is, 59 percent of the individuals who have never

experienced a transition are predicted to never end a marriage, compared to those who experienced three or more transitions, whose likelihood to never divorce is about 33 percent.166

Daughters of divorced parents divorce more than sons of divorced parents do.167 The risk of divorce in the first five years is 70168 to 76169 percent higher for the daughters of divorced parents than for daughters of intact marriages.170

**Marital Behaviors.** Parental divorce is also associated with lower marital quality for their children. This manifests itself in arguing more about the family,171 increased rates of jealousy, moodiness, infidelity, conflicts over money, excessive drinking, and drug use.172 Analysis of the 1987-1988 wave of the National Survey of Families and Households showed that children of divorce whose marriages were less than “very happy” communicated less and were more than twice as likely to argue frequently and to shout and hit when they argued.173

The child with an available father, both in the early and the adolescent years, is more companionable and responsible as an adult.174 In particular, “boys who feel close to their fathers, regardless of biological status, have better attitudes about intimacy and the prospect of their own married lives than boys who do not feel close to their fathers.”175

170 According to Amato and Booth’s research, the risk is highest when the divorce takes place before the child reaches age 13. The risk that the child will divorce decreases significantly when their parents’ divorce takes place during the teen years. Finally, parental divorce when their offspring are in their twenties may even inoculate them against divorce. See Paul Amato, “Explaining the Intergenerational Transmission of Divorce,” Journal of Marriage and Family 58 (1996): 638.
K. Increased Cohabitation among Children as Adults

Children of divorced parents are more likely than children of always-married parents to have more positive attitudes towards cohabitation\textsuperscript{176} and more negative attitudes towards marriage.\textsuperscript{177} When they leave home, they are two to three times as likely to cohabit\textsuperscript{178} and to do so earlier,\textsuperscript{179} especially if their parents divorced during their teenage years.\textsuperscript{180}

Daughters of divorced parents anticipated cohabiting before marriage, regardless of the amount of affection between them and their fathers. Among daughters of intact marriages, it was mainly those with poor relationships with their fathers who anticipated they would cohabit.\textsuperscript{181}

II. Effects on Religious Practice: Diminished Faithfulness

Following a divorce, children are more likely to abandon their faith,\textsuperscript{182} and they may be less traditional themselves, with a parental model differing from a lifelong commitment to marriage.\textsuperscript{183} Adult offspring raised in stepfamilies are less religious

\end{itemize}
(especially compared to those raised in happy married homes). Furthermore, abandoning religious practice deprives children of its beneficial effects in a host of areas: marital stability, sexual restraint, education, income, crime, addictions, physical and mental health, and general happiness.

III. Effects on Education: Capacity and Achievement

A. Diminished Learning Capacity

Outcomes and Achievements. Divorce and separation correlate positively with diminished school achievement and performance. Daniel Potter of the University of Virginia found that elementary school children who experience parental divorce immediately begin performing worse academically than their peers from intact families. This gap persists through elementary school.

![GPA English/Math by Family Structure]

Source: Adolescent Health Survey, Wave I. Adolescents grade 7-12.

Children exposed to unilateral divorce are less educated by adulthood. Children have lower educational aspirations and test scores during the process of their parents’ marital disruption. Children of divorced parents are also more likely to be held back a grade and have lower GPAs. High school students in intact families have GPAs 11 percent higher than those from divorced families. One study (controlling for parental education, parental occupation, family size, etc.), found that children whose parents divorce get about seven tenths of a year less education than children from intact families.

Children whose mothers divorced and remained divorced did worse over time on Peabody Individual Achievement Test reading recognition tests (which gauge children’s ability to recognize and pronounce words) than children from intact married families. By age 13, there is an average difference of half a year in reading ability between children of divorced parents and children from intact families.

In the Kent State University Impact of Divorce Project, which used a national sample study of 699 elementary students, children from divorced homes performed worse in reading, spelling, and math and repeated a grade more frequently than did children in intact two-parent families. The project’s findings led the researchers to conclude that children and young adolescents suffered long-term negative effects following divorce. Paternal absence is detrimental to cognitive test scores for young children, and paternal presence influences girls’

---

performance in math.\textsuperscript{197} Teenagers who experience parental divorce score lower than their counterparts from intact families on math, science, and history tests.\textsuperscript{198}

Some studies show that the correlation between adolescent family disruption and educational attainment is weaker after controlling for the family’s socioeconomic status. This finding likely reflects the influence of income on each.\textsuperscript{199} One of divorce’s attendant problems is the financial instability it inflicts on those who experience it.\textsuperscript{200}

Lack of family transitions after divorce does not eliminate the effect of the divorce on student academic performance, but it does provide their performance in math and social studies a certain degree of protection, compared to students who live in unstable families with multiple family transitions.\textsuperscript{201}

**Age at Divorce.** Norwegian research found that children who experience divorce early in life are likely to have lower educational outcomes, finding that the effect of divorce on education is strongest when the child is young.\textsuperscript{202} An American study, by contrast, found that those who had experienced a late divorce (between grades six and 10) were more likely to get low grades than children who experienced an early divorce (between kindergarten and grade five).\textsuperscript{203}

**Consequences of Moving.** Residential mobility accounts for 29 percent of the academic performance gap between children living in stepfamilies and children living with both biological parents.\textsuperscript{204} Moving tends to increase behavioral, emotional, and academic problems for adolescents.\textsuperscript{205}

\begin{itemize}
\item \textsuperscript{200} See section titled “Effect on the Marketplace: Financial Struggle.”
\item \textsuperscript{202} Fiona Steele, Wendy Sigle-Rushton, and Øystein Kravdal, “Consequences of Family Disruption on Children’s Educational Outcomes in Norway,” *Demography* 46, no. 3 (2009): 565.
\item \textsuperscript{204} Nan Marie Astone and Sara S. McLanahan, “Family Structure, Residential Mobility, and School Dropout: A Research Note,” *Demography* 31 (1994): 582.
\end{itemize}
Overall, the less instability of an sort in the child’s life following divorce, the less the impact on the child.

B. Behavior at School

Psychosocial Outcomes. One study found that children in pre-disrupted families (whose parents’ relationship would later dissolve) exhibit more academic, psychological, behavioral, and drug-related problems than children whose families remained intact.\(^{206}\) Daniel Potter, referenced above, also found that the deleterious effect of divorce on children’s psychosocial well-being is an important factor in poor math and reading scores.\(^{207}\)

Absence. One study found that children whose parents divorced skipped nearly 60 percent more class periods than children from intact families. Girls appeared to be more affected than boys.\(^{208}\)

Dropout, Suspension, or Expulsion. Children who experienced their parents’ divorce or separation are less likely to complete high school.\(^{209}\) An Australian study found that children of divorced families are 26 percent more likely to drop out of secondary school than children raised in intact families, and found that remarriage did not alleviate the effects of divorce on children’s educational attainment.\(^{210}\)

C. Less College Attainment for Children

Children whose parents\(^{211}\) or grandparents\(^{212}\) divorce tend to have fewer years of education. Divorce and separation reduces children’s likelihood of attending college.\(^{213}\) Furthermore, 33 percent of students who have already completed secondary school but who have experienced their parents’ divorce graduate from college, compared to 40 percent among their peers from intact families. However,

---

it seems that parental divorce has a greater impact on likelihood to complete secondary school than college.214

**College Expectations.** Youth living in married stepfamilies and cohabiting stepfamilies (i.e., with the mother’s live-in boyfriend/partner) and single-parent families after a divorce or separation have lower college expectations than youth who have always lived in intact families.215

IV. Effects on the Marketplace: Financial Struggle

A. Financial Weakness among Children of Divorce as Adults

Much of the economic impact of divorce on children is mediated through the parents, as research below demonstrates. However, parental divorce and separation lead to a greater likelihood of enduring economic hardship,216 as well as to decreased asset accumulation in adult life,217 eventual lower income218 and

---

occupational status, more materialism and compulsive buying, and higher likelihood of living in public housing by age 33.

Among women whose parents divorced, “statistically significant differences exist in educational attainment, level of household income, [and] receiving welfare...compared with women raised in intact marriages.”

A new concentration of the population into these classes, A new economy

**Family Income.** According to 1994 data reported by Mary Corcoran, professor of political science at the University of Michigan, children of divorced or separated parents (though better off than children of always-single parent families) are economically disadvantaged. “During the years children lived with two parents, their family incomes averaged $43,600, and when these same children lived with one parent, their family incomes averaged $25,300.” The household income of a child’s family dropped, on average, by about 42 percent

---

following a divorce.\textsuperscript{224} Parents’ accumulated wealth differs widely across family structures and affects the amount of financial support available for their children’s college education. Compared with married parents (59 percent), divorced parents (36 percent) are less likely to pay for all or most of their children’s college expenses. Divorced parents (29 percent) are actually more likely than married parents (17 percent) to provide no assistance at all.\textsuperscript{225}

**B. Financial Weakness among Divorced Women**

**Decreased Income.** Many women experience a substantial decline in their financial circumstances after divorce, which in turn affects their children. Analysis of the 1987-1988 and 1992-1994 waves of the National Survey of Families and Households found that household income for a mother and children fell by $13,000 after divorce. Additionally, their standard of living was 20 percent lower and their odds of owning a home were 12 percentage points lower.\textsuperscript{226}

The detrimental effects of divorce on women’s income vary based on the relative earnings capacity of the husband and wife. Women who experience the largest income losses (38.5 percent for a mother with one child) are “the ‘low education’ mother[s] who [were] married to a ‘high education’ man.”\textsuperscript{227} Conversely, highly educated mothers who were married to a less educated man experience the smallest effect of divorce on their equivalent household income (11.2 percent).\textsuperscript{228}

**Poverty.** High divorce rates mean that the children of poor families have fewer adults to support them. Nearly 56 percent of poor families with children had only one adult, but less than 14 percent of non-poor families with children have only one adult.\textsuperscript{229} One study goes so far as to assert that “[c]hanges of family structure [i.e., divorce] are by far the major cause of initial spells of poverty among female-headed households.”\textsuperscript{230}

\textsuperscript{224} Peggy O. Corcoran (Ann Arbor, MI: Survey Research Center, University of Michigan, 1994, unpublished paper).

\textsuperscript{225} Paul R. Amato, Sandra J. Rezac, and Alan Booth, “Helping Between Parents and Young Adult Offspring: The Role of Parental Marital Quality, Divorce, and Remarriage,” *Journal of Marriage and Family* 57 (1995): 373.

\textsuperscript{228} Matthew Gray and Bruce Chapman, “Relationship breakdown and the economic welfare of Australian Mothers and their children” (Crawford School of Economics and Government, The Australian National University, 2007, 2008), 28.

Most women entering welfare dependency do so because of divorce, particularly those women whose family’s income (prior to the divorce) was in the bottom half of the income distribution.231 Seventy-five percent of all women who applied for welfare benefits in the late 1980s did so because of a disrupted marriage or a disrupted relationship in which they lived with a man outside of marriage.232 Mothers who are employed at the time of the dissolution of their marriage are much less likely to become welfare recipients than mothers who are not already employed.233

There is some question regarding the efficacy of child support in decreasing poverty. Julia Heath found in 1992 that, particularly for white women, “[t]he most consistent positive predictor of length of poverty spell is number of children,” and wrote that this implied “that child support is not being sufficiently ordered by the courts, that the awards rendered are too small, or perhaps that the orders are not being enforced.”234 Philip Robins found in 1986 that “because the current legal system establishes such low child support award amounts, it does not appear to be an effective antipoverty device.”235 In general, as Paul Amato and Alan Booth wrote, “many men appear to view fatherhood as a package deal, accepting responsibility for children only as long as they are married to the mother.”236

V. Effects on Government: Increased Crime, Abuse, and Use of Drugs

A. Increased Crime Rates

Robert Sampson (then professor of sociology at the University of Chicago) reported, after studying 171 cities in the United States with populations over 100,000, that the divorce rate predicted the robbery rate of any given area,

regardless of its economic and racial composition. In these communities, he found that lower divorce rates indicated higher formal and informal social controls (such as the supervision of children) and lower crime rates. In 1994, it was reported in Wisconsin that the incarceration rate of juvenile delinquents was 12 times higher among children of divorced parents than among children of married parents. In a British longitudinal study of males aged eight to 32, David P. Farrington, professor of criminology at Cambridge University, found experiencing parental divorce before age 10 to be a major predictor of adolescent delinquency and adult criminality. Adolescents from divorced families (particularly those in divorced single-parent families) display more antisocial and violent behavior than adolescents in biologically intact families. An Australian parliamentary review of the literature found that divorce increases the likelihood that children will feel hostility and rejection.

![Family Structure: Comparative Rates Of Youth Incarceration](image)

---

238 Wisconsin Department of Health and Social Services, Division of Youth Services, “Family Status of Delinquents in Juvenile Correctional Facilities in Wisconsin” (1994). The data from the report were merged with Current Population Survey data on family structure in Wisconsin for that year to derive rates of incarceration by family structure.

Children of divorced parents are significantly more likely than children of intact married families to be delinquent by age 15, regardless of when the divorce took place.\textsuperscript{242} A 1985 study that tracked one thousand families with children ages six to 18 for six years found that children living in intact married families exhibited the least delinquency, while children with stepfathers were more likely to exhibit the most disruptive behavior. (In this study, the behavior of single-parent children fell between that of children of intact and stepfather families.)\textsuperscript{243}

Parental divorce contributes to what some studies term “externalizing behaviors,” which include weapon carrying, fighting, substance abuse, and binge drinking.\textsuperscript{244} Another study found that the sons of divorced parents are at no greater risk of involvement in delinquent behavior than boys living in intact families if the mother and father “engage in competent parenting.”\textsuperscript{245}

Good parenting on the part of divorced fathers achieved no such effects for the daughters of divorce, according to this same study. Among adolescent girls, there is a strong correlation between family structure and delinquency,\textsuperscript{246} hostile behavior,\textsuperscript{247} drug use, larceny, skipping school,\textsuperscript{248} and alcohol abuse.\textsuperscript{249} One study found that parental divorce and maternal nonresidence led to delinquent behavior in girls if the mother-daughter relationship was satisfying: A stronger relationship correlated to more frequent exhibition of delinquency.\textsuperscript{250}

\textsuperscript{242} Abbie K. Frost and Bilge Pakiz, “The Effects of Marital Disruption on Adolescents: Time as a Dynamic,” \textit{American Journal of Orthopsychiatry} 60 (1990): 544-555.
\textsuperscript{249} Abbie K. Frost and Bilge Pakiz, “The Effects of Marital Disruption on Adolescents: Time as a Dynamic,” \textit{American Journal of Orthopsychiatry} 60 (1990): 544-555.
B. Increased Abuse and Neglect

Child abuse is closely related to later delinquency, violence, and crime, and childhood abuse is more likely in the context of parental divorce. Subjection to pre-pubertal sexual contact is more common among children who have experienced their parents’ divorce, and individuals who had experienced sexual abuse were significantly more likely than those who had not experienced sexual abuse to have experienced an “adverse childhood event,” (such as parental divorce).

Child neglect, which is frequently more psychologically damaging than physical abuse, is much more commonly present in families of separated and divorced persons than of married persons.

Abuse is much higher among stepchildren (divorced and remarried) than among children of intact families. One study of Brazilian families reported that higher abuse rates in stepfamilies with stepfathers were attributable to higher incidence of mothers abusing their children. This study reported that children in stepfamilies with stepfathers were 2.7 times more likely to be abused than children in biologically intact households.

---

Living with a stepfather increases a child’s likelihood of subjection to pre-pubertal sexual contact.\textsuperscript{258} The rate of sexual abuse of girls by their stepfathers is at least six or seven times higher,\textsuperscript{259} and may be as much as 40 times higher,\textsuperscript{260} than sexual abuse of daughters by their biological fathers who remain in intact families.

A study of 26 instances of fatal child abuse reported that 62 percent of perpetrators were the stepfathers of the abused children and that 81 percent of perpetrators were engaged in cohabiting relationships with the victimized child’s mother (15 percent of perpetrators were married to the victimized child’s mother).\textsuperscript{261} Another study reported that children under age five were 50 times more likely to suffer fatal abuse if they lived in homes with an unrelated adult (particularly a mother’s boyfriend) than if they lived in a biologically intact family.\textsuperscript{262}

Margo Wilson and Martin Daly, professors of psychology at McMaster University, Canada, reported that children two years old and younger are 70 to 100 times more likely to be killed at the hands of stepparents than at the hands of biological parents.263 (Younger children are more vulnerable because they are so much weaker physically.) British data are milder, but the research is not as rigorous as the Canadian research. In Britain, fatal abuse of children of all ages occurs three times more frequently in stepfamilies than in intact married families.264

**C. Increased Use of Drugs and Alcohol**

Parental divorce (as previously stated) predicts externalizing behavior, such as tobacco use, alcohol consumption and binge drinking,265 and marijuana use.266 Parental divorce or separation also predicts increased adolescent use of other illegal drugs.267

---

Men who experienced their parents’ divorce as children (between ages seven and 16) are more likely to smoke as adults.\textsuperscript{268} Males who have experienced parental divorce are also more likely to use alcohol and drugs.\textsuperscript{269} Women who experienced parental divorce between ages seven and 16 (but not those whose parents divorced later) are more likely to smoke and to drink heavily as adults than women whose parents remained married.\textsuperscript{270}

![Ever Used Hard Drugs by Family Structure](chart)

VI. Effects on Child Health: Stunted Physical and Psychological Growth

A. Physical Health and Longevity

Parental divorce affects their children’s physical health and longevity. Those who experience parental divorce or separation are more likely to have health problems\textsuperscript{271} (often in spite of maternal remarriage\textsuperscript{272}) such as a significant increase

---

injury rates, a doubled risk of asthma, and increased risk of asthma-related emergencies. Children whose parents divorce are also more likely to contract cancer of the upper aerodigestive tract, the esophagus, anus, pancreas, lungs, and cervix. The authors add, “The results show that offspring of divorced parents have increased cancer risks at tobacco-related, alcohol-related and sex-related sites.” A Swedish study showed that young men with divorced parents had a slightly heightened risk of hospitalization and significantly increased risk of mortality.

The child of divorced parents has a higher risk of premature death. According to one study, parental divorce before the age of 21 is associated with a mortality risk increase of 44 percent and a lifespan shortened by an average of 4.5 years. A child’s mortality risk increases when his parents’ divorce occurs before reaching age four.

B. Increased Emotional and Psychiatric Burdens
Divorce wreaks havoc on the psychological stability of many children. A ranking generated by seventh and eighth grade students through a study in the late 1980s ranked parental divorce as the third most stressful life event of a list of 125 life events or experiences. Parental divorce was only ranked as less stressful than the death of a parent or close family member. Furthermore, the psychological effects of divorce are persistent: Children from divorced families

---

have more emotional problems\textsuperscript{283} and negative feelings\textsuperscript{284} and less psychological well-being\textsuperscript{285} than adults than those from intact families.

Upon the divorce of their parents, children experience a wide range of emotional reactions, including sadness,\textsuperscript{286} anger,\textsuperscript{287} loneliness,\textsuperscript{288} depression,\textsuperscript{289} heightened anxiety,\textsuperscript{290} worry, lower life satisfaction,\textsuperscript{291} lower self-esteem\textsuperscript{292} and self-confidence,\textsuperscript{293} fear, yearning, rejection, conflicting loyalties, and a sense of fault for their parents’ problems.\textsuperscript{294} An analysis by David Popenoe of the National

\begin{itemize}
\item Catherine E. Ross and John Mirowsky, “Parental Divorce, Life-Course Disruption, and Adult Depression,” \textit{Journal of Marriage and Family} 61 (1999): 1044.
\end{itemize}
Survey of Children found that divorce was associated with a higher incidence of several mental health problems in children: depression; withdrawal from friends and family; aggressive, impulsive, or hyperactive behavior; and either behaving disruptively or withdrawing from participation in the classroom. Parental divorce may also contribute to the development of mood disorders, bipolar I disorder, dysthymia (mild chronic depression), depression, and post-traumatic stress disorder.

When children experience parental divorce before age five, they are particularly vulnerable to emotional conflicts at the time of their parents’ separation. They will frequently cling to their parents and “regress” to bedwetting and other behaviors more characteristic of younger children. Older children, rather than clinging, frequently withdraw from home life and seek intimacy elsewhere. If divorce occurs while the children are teenagers (12 to 15 years old), they tend to react in one of two very different ways: by attempting to avoid growing up or by attempting to “speed through” adolescence. Finally, early sexual activity, substance abuse or dependence, hostile behavior, and depression are all more likely following divorce. These reactions are most likely if the parents divorced prior to age five, slightly less so if they divorce after age 10, and seemingly least of all during the five- to 10-year-old phase.

Divorce is related to increased depression and anxiety for both boys and girls of all ages. However, boys find parental divorce more emotionally disturbing than girls do, and that “boys with divorced parents tended to be more depressed

---

than those from two-parent families regardless of the psychological adjustment, level of conflict, or quality of parenting manifested by their parents.\textsuperscript{303}

Psychological problems are less severe for those whose pre-divorce families were high-conflict families.\textsuperscript{304} According to Paul Amato of the Department of Sociology at Pennsylvania State University, child and adult well-being may actually improve after the end of an extremely conflicted marriage.\textsuperscript{305}

**International Findings.** The British National Longitudinal study of children born in 1958 found that those who experienced parental divorce between ages seven through 16 experienced significant increase in their risk of psychopathology.\textsuperscript{306} A large Finnish study found that 22-year-old children of divorced parents experienced more job loss, that sons experienced more conflict with supervisors and teachers, and that daughters experienced more interpersonal conflict.\textsuperscript{307} A large sample from Sweden (over 14,000 participants) confirms the negative effects of parental divorce on mental health, no matter the socioeconomic status of the family.\textsuperscript{308} German research yields similar findings,\textsuperscript{309} as does an Australian parliamentary report.\textsuperscript{310}

C. Damaging Behaviors

Suicide. Child suicide is often triggered by thoughts that his divorced parents reject him or have lost interest in him. The fact that the suicide rate has risen along with the divorce rate is no coincidence. One study reported that risk of a suicide attempt was higher in divorced families, though the association was eliminated after controlling for adverse experiences. As the work of Patricia McCall, a sociology professor at North Carolina State University, shows, the strongest demographic indicator of suicide is the family structure within which a person resides: the divorced family structure has the highest suicide rate.

Women from divorced families are 1.46 times as likely to attempt suicide as women from intact families. An earlier study by the same author found that women raised in divorced families are 1.33 times as likely to attempt suicide; this finding holds true even after adjusting for various confounding factors, such as age, race, and income. This link between parental divorce and the rise in adolescent suicide has been found again and again in the literature. Cross-cultural studies of Japan and the United States have clearly demonstrated the link between divorce and suicidal thought.

---

317 Dana Lizardi, Ronald G. Thompson, Katherine Keyes, and Deborah Hasin, “Parental Divorce, Parental Depression, and Gender Differences in Adult Offspring Suicide Attempt,” Journal of Nervous and Mental Disease 197 (2009): 901.
Destructive Behavior. A meta-analysis of 72 studies shows that parental divorce has a very strong effect on the likelihood of engaging in juvenile delinquent acts.320 Boys from divorced families exhibit more risky behavior than boys from intact families.321 Confirming the Amato conclusion referred to earlier,322 children in high-conflict households whose parents remain married exhibit more severe destructive behavior than children whose parents actually divorce.323

VII. Research Has Not Yet Found the Terminus of These Long-term Effects

Unlike the experience of divorced former spouses, a child’s suffering does not reach its peak at the divorce and then level off. Rather, the effect of the parents’ divorce can be played and replayed throughout the next three decades of a child’s life.324 For instance, an Australian parliamentary study tracked children whose parents divorced in 1946, and tested them two and three decades later. Even 30 years after the divorce, negative long-term repercussions still clearly affected the income, health, and behavior of many of the grown children.325 As Paul Amato writes, “Though some adults and children adjust relatively quickly to divorce...others exhibit long-term deficits in functioning.”326 Children’s well-being over the long term is determined by circumstances both prior to and after their parents’ divorce.327

Intergenerational Effects. Divorce has a profound intergenerational effect. One study showed that “ever-divorced grandparents live significantly farther away from the parent and grandchild...report a weaker relationship with the

---

parent…and are more likely to be part of a family system where both generations have divorced (13 [percent] vs. 3 [percent]).

Paul Amato and Jacob Cheadle studied the long-reaching effects of divorce across three generations and found that “[d]ivorce in the first (G1) generation was associated with lower education, more marital discord, weaker ties with mothers, and weaker ties with fathers in the third (G3) generation. These associations where mediated by family characteristics in the middle (G2) generation, including lower education, more marital discord, and greater tension in the early parent-child relationships.” This study demonstrates that parental divorce has consequences for children and subsequent generations. Amato and Cheadle also reported in this study that “[p]arental divorce doubled the odds of divorce” in the child’s own life.

Soon to Come Increase in Costs. Of special note is the finding that children of divorce are less likely to think they should support their parents in old age. This finding portends a monumental public cost problem for the frequently-divorced baby boom generation as it becomes the dependent elderly generation in the first half of the 21st century.

Conclusion

The family is the building block of society, and marriage is its foundation. Divorce has pervasive weakening effects on children and on all of the five major institutions of society—the family, the church, the school, the marketplace, and government itself. However, this foundation is growing weaker as fewer adults marry, more adults divorce, and more adults choose single parenthood or cohabitation.

---

332 Between 1960 and 1990, there has been a 41 percent decline in marriage. The number of always-single persons has risen from 21 million in 1970 to 46 million in 1996. At the same time, cohabitation has jumped from 430,000 in 1960 to 4.25 million in 1998, an increase by a factor of 10. The literature also shows that cohabitation itself is linked to an increased likelihood of divorce; those who cohabit before marriage divorce at twice the rate of those who do not. Also, 40 percent of cohabiters separate before marrying; these former cohabiters, when they finally marry, divorce at twice the rate of those who marry their first cohabiting partner and at about four times the rate of those who do not cohabit before marriage. See: Larry L. Bumpass, “What’s Happening to the Family? Interactions Between Demographic and Institutional Change,” Population Association of America, 1990 Presidential Address, *Demography* 27 (1990), 483-498.
Society’s major institutions (family, church, school, marketplace and government) all have a great interest in reducing divorce to almost zero, for it weakens each institution by weakening the human capacities of each laborer, citizen, worshiper, and student that it touches. Leaders of these institutions must shoulder their responsibility to end the culture of rejection. Policymakers, pastors, and academics all bear the responsibility to motivate them in that direction.

American children today are weaker than children of previous generations—intellectually, morally, emotionally, and physically, and our human capital is decreasing.333 Moreover, the American nation today is socially weaker than in the past, and the America of tomorrow will be weaker still. For instance, few are willing to point to divorce as a major contributor to our economic problem. Americans in the media and in politics are comfortable pointing at a failing educational system or at teenage unwed mothers and the deleterious effects they have on children and society, but no one likes to dwell on the pervasive and broad negative effects of divorce.

It is necessary to know reality and the facts in order that we see and understand the whole bleak picture and are moved to set about the task of rebuilding a culture of families based on marriage, a culture of love and belonging, with all the societal props and protections necessary to make this familial norm normal once again. Each and every child deserves it. The nation needs it.

---
