Women Who Cohabited with Eventual First Husband
By Family Structure and Religious Practice

Source: National Survey of Family Growth, Cycle 6 (2002)

This chart looks at women who cohabited with their eventual first husband at the extremes of four demographic quadrants.

These four quadrants are derived from combining two sets of family structures (always-intact vs. non-intact) and two sets of religious attendance (high vs. low).*

The families occupying the four corners (or four extremes) of these quadrants are:

- The always-intact married family that worships weekly;*
- The always-intact married family that never worships;*
- The non-intact family* that worships weekly;*
- The non-intact family* that never worships.*

(The non-intact group consists of women in the following categories: married stepfamily, cohabiting stepfamily, single divorced parent, and always single parent. In all these structures, there has been rejection between the biological father and mother, and thus the original pairing is no longer intact.)*

Women Who Cohabited with Eventual First Husband by Family Structure and Religious Practice

Family Structure: According to the National Survey of Family Growth, Cycle 6 (2002), 42.5 percent of women who grew up in an intact married family cohabited with their eventual first husband, followed by women from single divorced parent families (55 percent), intact cohabiting families (56.2 percent), married stepfamilies (59.5 percent), always single parent families (69.4 percent), and cohabiting stepfamilies (72.9 percent).¹

Religious Practice: The National Survey of Family Growth shows that 33.7 percent of women who worshiped at least weekly were less likely to cohabit with their eventual first husband, followed by those who attended religious services between one and three times a month (61.6 percent), those who attended religious services less than once a month (66.8 percent), and those who never attended religious services (69.8 percent).

Family Structure and Religious Practice Combined: Women who were least likely to have cohabited with their eventual first husband were those who grew up in an intact married family and who worshiped at least weekly at the time of the survey. According to the National Survey of Family Growth, 27.1 percent of women who grew up in an intact married family and who worshiped at least weekly cohabited with their eventual first husband, followed by women who grew up in other family structures and worshiped at least weekly (44.8 percent), those who grew up in intact married families and never worshiped (57.2 percent), and those who grew up in other family structures and never worshiped (71.3 percent).

Related Insights from Other Studies: Several other studies corroborate the direction of these findings. Wendy Manning of Bowling Green State University and colleagues reported that adolescents who “have greater religiosity report lower cohabitation expectations” and that “adolescents from single, cohabiting, and married stepparent families have greater expectations to cohabit than do teens living with two biological parents.”²

Jay Teachman of Western Washington University also found that those “who grew up with two biological parents...were less likely to cohabit before marriage.”³ Valerie Martin of McGill University and colleagues also reported that “[s]ignificantly higher levels of entry into cohabitation, as opposed to marriage, and higher levels of divorce were found among children of divorce, compared to children from intact families.”⁴ As the data show, infrequent religious attendance and a non-intact family correlate significantly with cohabitation before first marriage.
